

Bneuron milk enters into South Korean dairy market

11 March 2024 | News

The product is scientifically proven to offer multiple benefits for the brain and nervous system

The product is scientifically proven to offer multiple benefits for the brain and nervous system

Bneuron milk, a breakthrough product in the health and wellness industry, has been entering the South Korean dairy market. The product is scientifically proven to offer multiple benefits for the brain and nervous system. By delivering essential nutrients that prevent and treat stroke and vestibular disorders, Bneuron milk helps consumers improve their cognitive functions, sleep quality, and overall well-being. Bneuron milk is the "golden" solution for a healthier and happier life.

Bneuron applies "Ultrasound Assisted Extraction" - an ultrasound technology with the ability to enhance the effectiveness of nutritional active ingredients in milk by using strong ultrasound waves that can penetrate deeply into cell membranes. This method keeps the biological activity of active ingredients at temperatures lower than 70 degrees Celsius, which can prevent loss and evaporation and also increase the recovery rate of active ingredients compared to traditional methods.

To apply this advanced technology to the mass production process, the company has equipped an advanced and modern production line that fully meets GMP and FDA standards. The high-capacity machinery and infrastructure system is operated and controlled by a team of experienced nutritionists along with leading technical experts in the industry. From importing raw materials to packaging, Bneuron carries out strict control to ensure that each product that comes to the user has the best quality according to prescribed standards.
