Raffinerie Tirlemontoise, BENEIO and Puratos collaborate with Belgian farmers to launch a joint climate farming project

Raffinerie Tirlemontoise, BENEIO and Puratos collaborate with Belgian farmers to launch a joint climate farming project

Raffinerie Tirlemontoise, a beet sugar producer, BENEIO, a leading manufacturer of functional ingredients, and Puratos, a global leader in bakery, patisserie, and chocolate ingredients, have joined forces to launch a pioneering Climate Farming Project. The ambitious initiative supports Belgian farmers in implementing more sustainable farming practices and promotes regenerative agricultural principles that contribute to enhancing soil health and reducing environmental impact.

Addressing climate change and ensuring resilient farming practices is crucial to meet the demands of future generations. The project partners recognise that this requires collaboration between the agricultural sector and the food industry. Empowering farmers through training and stimulating the exchange of knowledge are key components of this joint commitment.

The project is already underway and will run until 2025, involving 15 pilot farms across Belgium. Together, they will cultivate sugar beet, wheat and chicory according to various regenerative farming methods in an area equivalent to the size of more than 1,100 football fields.

Throughout the project, farmers will work on specific farming measures. This includes strategies such as reducing mineral nitrogen fertilisation and pesticide use through more organic means and enhancing biodiversity by planting flower strips and hedges next to the fields. Improving the biomass of cover and catch crops that are planted after the main crop harvest will also reduce soil erosion and enhance soil fertility and biodiversity in agroecosystems. In addition, it will aim to reduce the tillage and soil work to different degrees as a measure to combat erosion. These efforts are supported by the localised application of mineral fertilisers, the use of organic fertilisers, and biopesticides and the early sowing of multi-species catch crops.
