NK Dairy Equipments LLP Strengthens Global Presence with Dairy Processing Solutions Across 32+ Countries

27 November 2026 | News

The Haryana-based manufacturer supplies dairy processing machinery and integrated plant solutions to businesses across India and international markets

NK Dairy Equipments LLP, a manufacturer and exporter of dairy processing machinery, supplies equipment and processing solutions across 32+ countries. The business was started in 2005 by Himpreet Kaur and Manpreet Singh. It serves businesses ranging from small dairy units to large processing plants.

Based in Yamunanagar, Haryana, the company works with private dairy units, cooperative societies, institutional buyers and other dairy organisations. Its portfolio covers several stages of production. These include milk reception, chilling, pasteurisation and storage. It also supplies machinery for value-added products such as paneer, curd, butter, ghee and khoa.

Commenting on the company's growth, Himpreet Kaur, Co-founder of NK Dairy Equipments LLP, said, “Every dairy business has different requirements. A small processing unit and a large dairy plant may work with the same raw material, but their needs can vary considerably. Production capacity, available infrastructure and investment priorities all influence equipment choices. The focus has been on understanding these requirements and providing solutions that fit the way each business operates.”

Its international markets span Africa, Southeast Asia, the Middle East, Australia and New Zealand, the United States and the United Kingdom. Projects include equipment supply for new dairy facilities. The company also supports existing businesses looking to expand their processing capacity.

Dairy processors have different production needs. These depend on their scale, product range and operating conditions. NK Dairy Equipments LLP supplies individual machines as well as integrated processing systems. Depending on the project, these solutions can include plant layout planning, stainless-steel pipelines and Cleaning-in-Place (CIP) systems. Installation and commissioning support are also available.

Manpreet Singh, Co-founder of NK Dairy Equipments LLP, added, “International projects require an understanding of local operating conditions and production goals. Equipment must work as part of a larger processing system. It cannot be treated as an isolated installation. As the company serves more markets, the priority remains practical engineering, reliable execution and solutions suited to each customer's requirements.”
